

# DELIVERING ROBUST IN-FLIGHT CONNECTIVITY WITH LUXSTREAM

Business travellers expect to access the same applications they use on the ground while cruising at 35,000 feet. LuxStream is our turnkey solution for the business aviation market, enabling in-flight connectivity (IFC) services that keep passengers accessing high-bandwidth applications on any route—from takeoff to landing.

## Fastest download speeds available

The only IFC service that offers speeds up to

**25**

Mbps in the US

**15**

Mbps globally

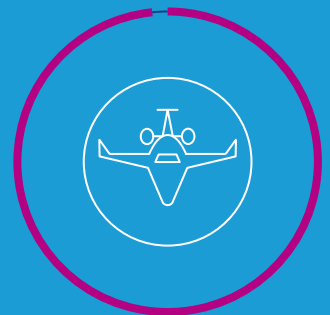

## Unmatched reach

Our global network covers

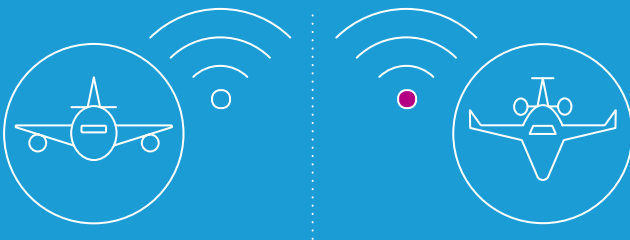

**99.83%**

of all flight time

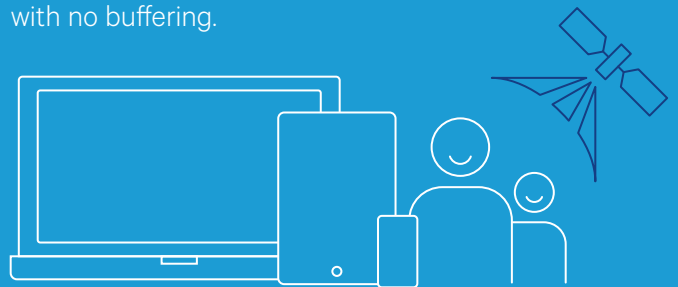

## A dedicated business aviation network

Our business aviation network doesn't share capacity with commercial airlines or consumer broadband.

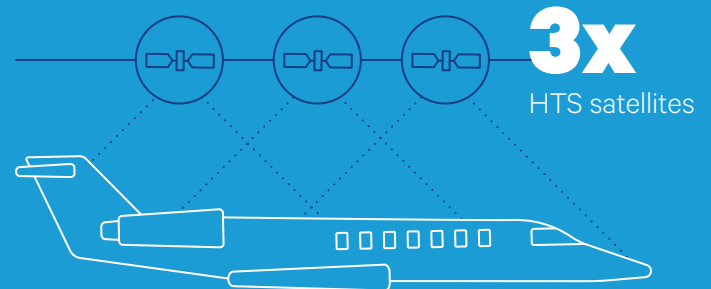

## More users. More devices. More apps.

High-throughput spot beams enable passengers to stream Ultra HD content with no buffering.

## Infrastructure optimised for aero

The industry's most modern high-throughput satellite (HTS) fleet, offering up to three times more throughput than competitive solutions, and combined with an advanced ground system to enable fast-moving aircraft to automatically cross multiple spot beams with no impact on connectivity.
